

# Hilti HUS3 SCREW ANCHOR

**Technical Datasheet**

**Update: Nov-19**

# HUS3 Screw anchor

Ultimate performance screw anchor

Anchor version		Benefits
	HUS3-H (6-14)	- High productivity - less drilling and fewer operations than with conventional anchors
	HUS3-HF (8-14)	- ETA approval for cracked and non-cracked concrete - ETA approval for Seismic C1 and C2
	HUS3-C (8-10)	- ETA approval for adjustability (unscrew-rescrew) - High loads
	HUS3-A (6)	- Small edge and spacing distance
	HUS3-P (6)	- abZ (DIBt) approval for reusability in fresh concrete ( $f_{ck, cube} = 10/15/20$ Nmm <sup>2</sup> ) for temporary applications
	HUS3-PL (6)	- Three embedment depths for maximum design flexibility - No cleaning required
	HUS3-PS (6)	- HUS3-HF with multilayer coatings for additional corrosion protection
	HUS3-I (6)	- Forged-on washer and hexagon head with no protruding thread
	HUS3-I Flex (6)	- Through fastening

a) All data given in this section according ETA-13/1038 issue 22-07-2019.

## Static and quasi-static loading data (for a single anchor)

### All data in this section applies to:

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Steel failure
- Minimum base material thickness
- Concrete C 20/25,  $f_{ck,cube} = 25 \text{ N/mm}^2$

Critical spacing for concrete cone failure	$s_{cr,N}$ [mm]	$3 h_{ef}$									
Critical edge distance for concrete cone failure	$c_{cr,N}$ [mm]	$1,5 h_{ef}$									

For spacing (edge distance) smaller than critical spacing (critical edge distance) the design loads have to be reduced (see system design resistance).

Critical spacing and critical edge distance for splitting failure apply only for non-cracked concrete. For cracked concrete only the critical spacing and critical edge distance for concrete cone failure are decisive.

The anchor can be adjusted max. two times.

The total allowed thickness of shims added during the adjustment process is 10 mm.

The final embedment depth after adjustment process must be larger or equal than  $h_{nom2}$  or  $h_{nom3}$ .

For size 14 only, hole cleaning is not required under specific conditions. Check instructions for use for more information.

**All data in this section applies to the following conditions:**

- Strength class,  $f_{ck,cube} \geq 10 \text{ N/mm}^2$
- Only temporary use
- Screw is reusable, before each usage it must be checked according to Hilti instruction for use with the suited tube Hilti HRG
- Design resistance and recommended loads are valid for single anchor only
- Design resistance as well as recommended loads are valid for all load directions and valid for both cracked and non-cracked concrete
- Minimum base material thickness
- No edge distance and spacing influence
- Valid for HUS3-H only
- All data in this section for sizes 10 and 14 according to DIBt approval Z-21.8.2018 issue 2014-04-01

## Basic loading data (for a single anchor) in solid masonry units

### All data in this section applies to:

- Load values valid for holes drilled with TE rotary hammers in hammering mod
- Correct anchor setting (see instruction for use, setting details)
- The core/material ratio may not exceed 15 % of a bed joint area
- The brim area around holes must be at least 70mm
- Edge distances, spacing and other influences, see below
- All data given in this section according to Hilti Technical Data

## Permissible anchor location in brick and block walls

### Edge distance and spacing influence

- The technical data for HUS3 anchors are reference loads for MZ 12, KS 12 and PPW 6. Due to the large variation of natural stone slid bricks, on site anchor testing is recommended to validate technical data
- The HUS3 anchor was installed and tested in center of solid bricks as shown. The HUS3 anchor was not tested in the mortar joint between solid bricks or in hollow bricks, however a load reduction is expected
- For brick walls where anchor position in brick can not be determined, 100 % anchor testing is recommended
- Distance to free edge free edge to solid masonry (Mz and KS) units ≥ 200mm
- Distance to free edge free edge to solid masonry (autoclaved aerated gas concrete) units ≥ 170mm
- The minimum distance to horizontal and vertical mortar joint ( $c_{min}$ ) is started in drawing below
- Minimum anchor spacing ( $s_{min}$ ) in one brick/block is ≥ 80 mm

### Limits

- All data is for multiple use for non-structural applications
- Plaster, graveling, lining or levelling courses are regarded as non-bearing and may not be taken into account for the calculation of embedment depth
- The decisive resistance to tension loads is the lower value of  $N_{rec}$  (brick breakout, pull out) and  $N_{max,pb}$  (pull out of one brick)

### Basic loading data for single anchor in Hollow core slab
